Abstract

Method for improving the quality of an audio transmission via a packet-oriented communication network and communication system for implementing the method

The invention permits the improvement of the quality of an audio transmission in which audio data containing samples (A1, ..., A8) of an audio signal are packets asynchronously /transmitted in data packet-oriented communication network (LAN). According the audio data to be transmitted to the invention, and/or already transmitted are digitally converted in the sense of altering their sampling rate and/or in the sense of modifying the duration (L1+2*L2+L3) of signal represented by the audio data whilst audio largely/ retaining its pitch. The conversion performed in dependence on a transmission situation currently detected, in such a manner that a quality of service of the audio transmission is optimized.
